PROFESSIONAL SUMMARY

Backend developer who builds systems that solve real data problems — from geospatial disambiguation to automated scraping pipelines. Comfortable owning a project end-to-end: designing the database, writing the backend, testing it, and deploying it. Led teams to Round 2 in national hackathons against 20,000+ registrations and 700+ competing companies.

EDUCATION

Thakur College of Engineering and Technology Mumbai, Maharashtra
Bachelor of Engineering, Computer Engineering 2024 – Present
Currently in Semester 5 (Third Year) — ***CGPA: 8.70*** *(Semesters 1–4)*

TECHNICAL SKILLS

- **Languages:** C++, Java, Python, HTML, CSS, JavaScript
- **Backend & APIs:** FastAPI, REST APIs, API Integration, Unit Testing, Integration Testing
- **Databases:** PostgreSQL, SQL, PostGIS, Supabase
- **Core CS:** Data Structures & Algorithms, OOP, DBMS, Operating Systems, Computer Networks
- **Tools:** Git, GitHub, Eclipse IDE, Tomcat, GitHub Actions

PROJECT EXPERIENCE

GeoCoderZ 2026
FastAPI, spaCy, PostGIS, Supabase, React-Leaflet — Live Demo

- Built a system that automatically identifies the correct location from ambiguous incident reports (e.g. two towns with the same name) via a 4-stage pipeline — extraction, normalization, candidate lookup, disambiguation — backed by a 780K+ row gazetteer with 121K+ alternate names.
- Cut repeat-lookup response time in half (2813 ms → 1391 ms, measured) by layering a two-level cache over a six-table PostgreSQL/PostGIS schema, so the system gets faster the more it's used.
- Built a scoring engine that weighs regional context and spatial proximity instead of guessing by population alone, so it doesn't confidently return a wrong answer — verified with a 21-case automated test suite (unit + live integration).
- Designed a fallback so that when a location can't be confidently matched, the system reports a clear reason instead of silently returning the wrong coordinates.

ScrollPing 2026 – Present
Python, PostgreSQL, Supabase, Requests, Telegram Bot API, GitHub Actions — GitHub

- Building an automated tool that tracks manga/manhwa/novel releases across multiple aggregator sites and notifies subscribers on Telegram, built to run entirely on free-tier infrastructure.
- Ran a 51-hour empirical test (18 scheduled runs) to check whether free GitHub Actions infrastructure would get IP-blocked by target sites, instead of assuming — confirmed 100% success across all 6 target sites, avoiding the need for a paid anti-bot proxy service.
- Architected the pipeline so one site going down doesn't break the whole run, with automatic retries on network and database failures.
- Modeled a database schema that handles tricky real-world cases like fractional chapter numbers (e.g. `66.5`) and per-user subscriptions, while staying within free-tier rate limits.

HACKATHONS & ACHIEVEMENTS

- **Smart India Hackathon 2026 (Internal Round):** Lead, backend owner, and architect for a 6-person group building GeoCoderZ.
- **Mumbai Hacks 2025:** Led a 3-person team to Round 2 out of 20,000+ registrations, 700+ companies (3,500+ on-site builders); drove product direction and DB design for Hisab-Kitab, pitched to industry judges.
- **Jaipur Cybrathon:** Led a 3-person team into the Round 2 in-person round, among the few shortlisted nationally; same product/DB role on Hisab-Kitab.
- **Hackarena 2.0:** Advanced to Round 2 Zonals with Hisab-Kitab; incorporated judge and mentor feedback to refine product scope and direction.
- **DSA:** Working through NeetCode 150 (currently Binary Search) in Python, C++, and Java.
